SUBJECT: FSU Facility for Arts Research - Radon Evaluation

The Facility for Arts Research (Arts Research) at Florida State University (FSU) has been evaluated for radon content due to indoor air quality questions that have been raised regarding other buildings on the FSU campus. From August 23 to 25, 2023, radon measurements were collected at fourteen (14) locations at Arts Research. The 48-hour charcoal canister measurements were collected by a state-certified radon contractor, in accordance with standard protocols of the United States Environmental Protection Agency (USEPA) and the Florida Department of Health (FDOH). All of the radon values were less than the 4 picoCurie/liter (pCi/L) USEPA Action Level (all values below detectable levels at <0.4 pCi/L). Results for the August 2023 sampling event are summarized in the attached table.

Detectable radon levels are ubiquitous throughout the state, with most areas of Florida exhibiting low radon. Outdoor levels typically are in the 0.4 to 0.5 pCi/L range, and indoor levels regularly range from 1 to 2 pCi/L. Radon comes from decay of natural radium, and elevated indoor radon is related to local geology. Radon often is present in clays, phosphate rock, and igneous rocks, like granite, and can originate from bedrock far below land surface. Because it is a naturally occurring substance, exposure is common and unavoidable.

The data summarized herein reflect a condition that is consistent with many buildings in Florida and throughout the United States, and the radon conditions at the Facility for Arts Research do not represent a health concern. Further investigation regarding radon is not recommended at this time.

RADON MEASUREMENTS - Facility for Arts Research, Florida State University

Location	Sampling Dates	Number of Samples	Min pCi/L	Max pCi/L	Notes
First Floor	23 Aug to 25 Aug 2023	14	<0.4	<0.4	No results > 4 pCi/L

pCi/L = picocuries per liter
